Computer Systems Security

Lab 1. Secure communication for IoT

2020-04-08, 13:00-14:00, Wednesday

Jie Zhang

Department of Computer Science and Software Engineering

Email: jie.zhang01@xjtu.edu.cn

Office: SD561

Outline

- Introduction
- IEEE 802.15.6
- Bluetooth 5.0
- TLS 1.3

Tasks

- Get familiar with experimental codes and environment of AKE protocols in IEEE 802.15.6, Bluetooth 5.0, and TLS 1.3
- 3 weeks

1. Introduction

Communication

- Communication takes place at every moment.
- Many of them involve sensitive information.

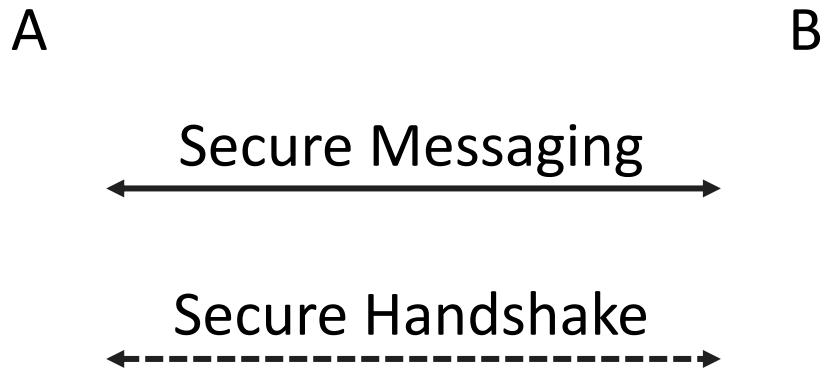

How to protect communication

- Confidentiality
 - Encryption
 - E.g., AES
- Integrity / Authenticity
 - Message authentication code
 - E.g., HMAC,CBC-MAC
 - Digital signature

Shared key

Protecting communication

- 2 phases

Protecting communication

- Phase 1, Secure handshake
 - Establish authenticated shared keys
 - Also known as
 - Authenticated key establishment.
 - Authenticated association (IEEE 802.15.6)
 - Secure Pairing (Bluetooth)
- Phase 2, Secure messaging
 - Use Encryption, Message Authentication Code, etc., to protect messages under shared keys.

Authenticated key exchange (AKE)

- Definition
 - Authenticated key establishment is a cryptographic mechanism that provides two or more parties communicating over an open network with a shared secret key.
- Category
 - Key transport protocols. In a key transport protocol, the shared secret key is created by one party and securely transmitted to the second party.
 - Key agreement (or exchange) protocols. In a key exchange protocol, both parties contribute information which is used to derive the shared secret key.

AKE in international standards

- Communication standards
 - IEEE Standard 802.15.6 (WBAN)
 - Bluetooth Specification
- Security standards
 - Transport Layer Security (TLS)

IEEE standard 802.15.6 (WBAN)

- WBAN – Wireless Body Area Networks
 - Short-range, wireless communications in the vicinity of, or inside, a human body (but not limited to humans)
- Security Services
 - Based on ECDH
- Security Association
 - Password Authenticated Association
 - Display Authenticated Association

Bluetooth specification v 5.0

- Bluetooth wireless technology
 - a short-range communications system intended to replace the cable(s) connecting portable and/or fixed electronic devices.
 - key features: robustness, low power consumption, and low cost.
- Security Overview
 - v 2.1+ introduced secure simple pairing (utilizes ECDH)
- Secure Simple Pairing
 - Numeric Comparison
 - Just Works
 - Out Of Band
 - Passkey Entry

Transport layer security (TLS)

- Primary goal
 - provide a secure channel between two communicating peers
- Components:
 - A handshake protocol
 - authenticates the communicating parties, negotiates cryptographic modes and parameters, and establishes shared keying material
 - A record protocol
 - uses the parameters established by the handshake protocol to protect traffic between the communicating peers

2. ECDH

Diffie-Hellman key agreement

G : cyclic group

q : prime, order of G

g : generator of G

Decisional Diffie-Hellman (DDH) problem:
Given g^x, g^y, g^z , distinguish g^{xy} from a
uniform group element

Hardness

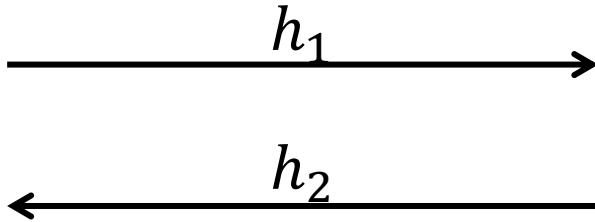

G, q, g

$$k_1 = (h_2)^x$$

$$x \leftarrow Z_q$$

$$h_1 = g^x$$

$$k_2 = (h_1)^y$$

$$y \leftarrow Z_q$$

$$h_2 = g^y$$

Elliptic curve Diffie-Hellman key agreement

- E : elliptic curve group
- q : prime, order of E
- G : generator of E

ECDDH problem: Given E, G, yG ,
distinguish xyG from a uniform group
element

Hardness

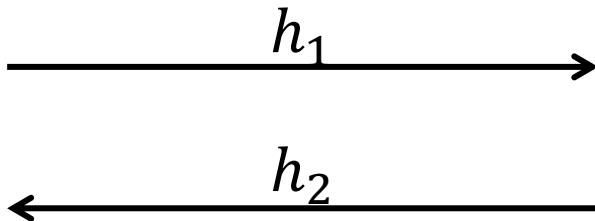

E, G, q

$$k_1 = xh_2$$

$$x \leftarrow Z_q$$

$$h_1 = xG$$

$$k_2 = yh_1$$

$$y \leftarrow Z_q$$

$$h_2 = yG$$

Elliptic curve used in cryptography

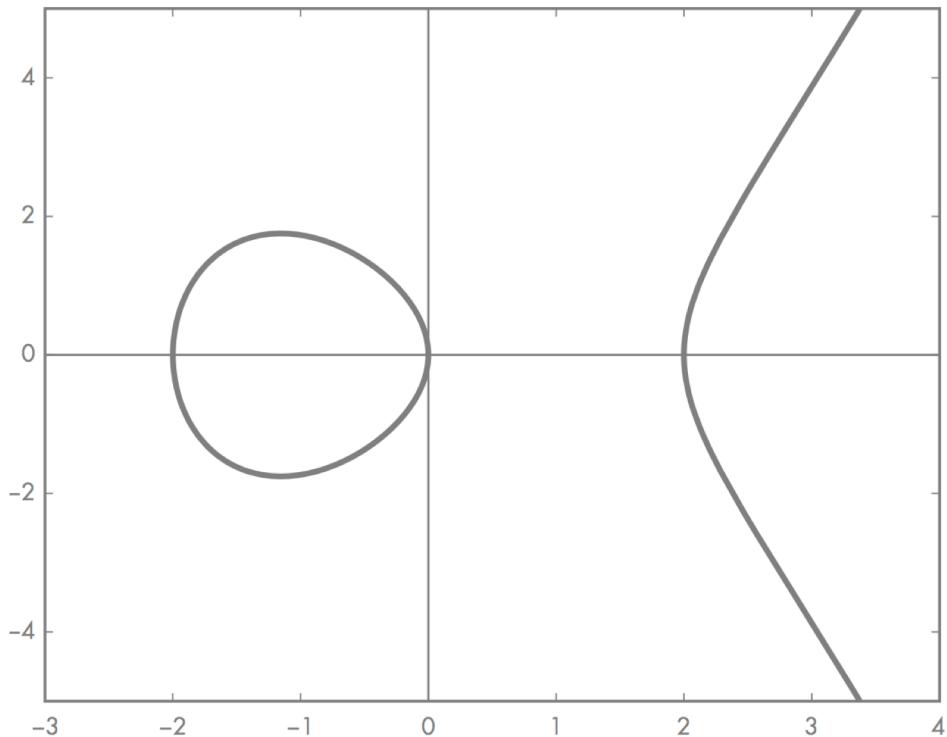

- An elliptic curve as used in cryptography is typically a curve whose equation is of the form

$$y^2 = x^3 + ax + b$$

- a, b : constants that define the shape of the curve

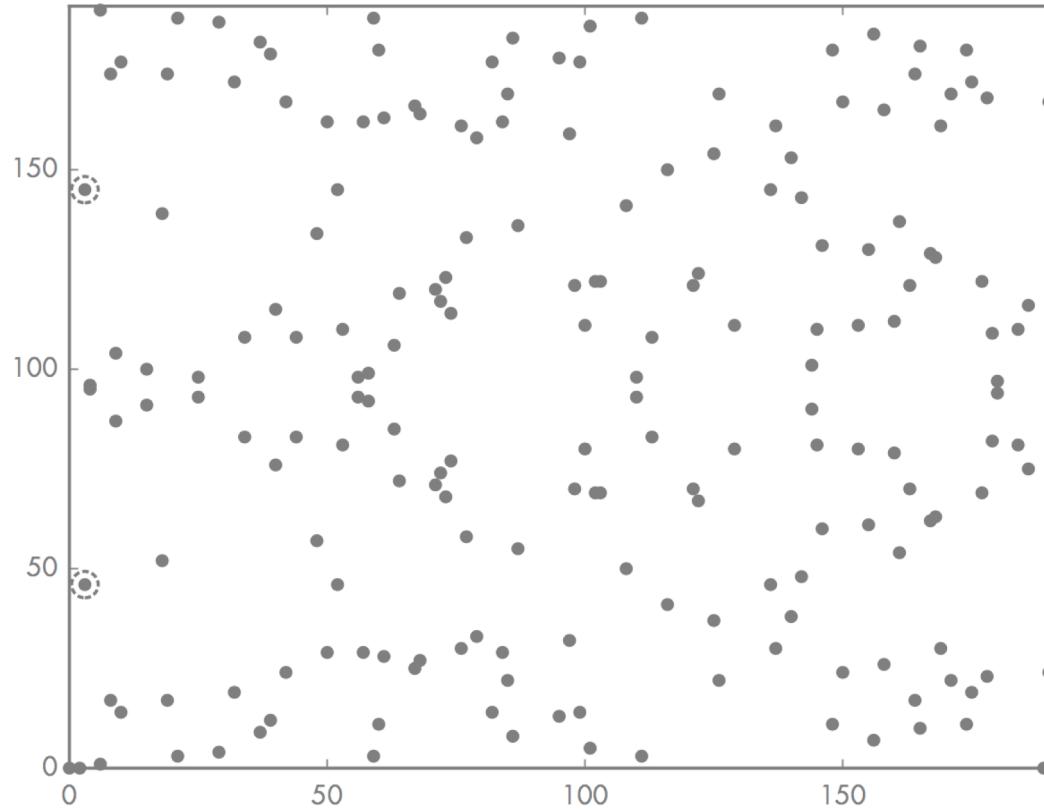

- Weierstrass form

- Example: $y^2 = x^3 - 4x$
 - over real numbers

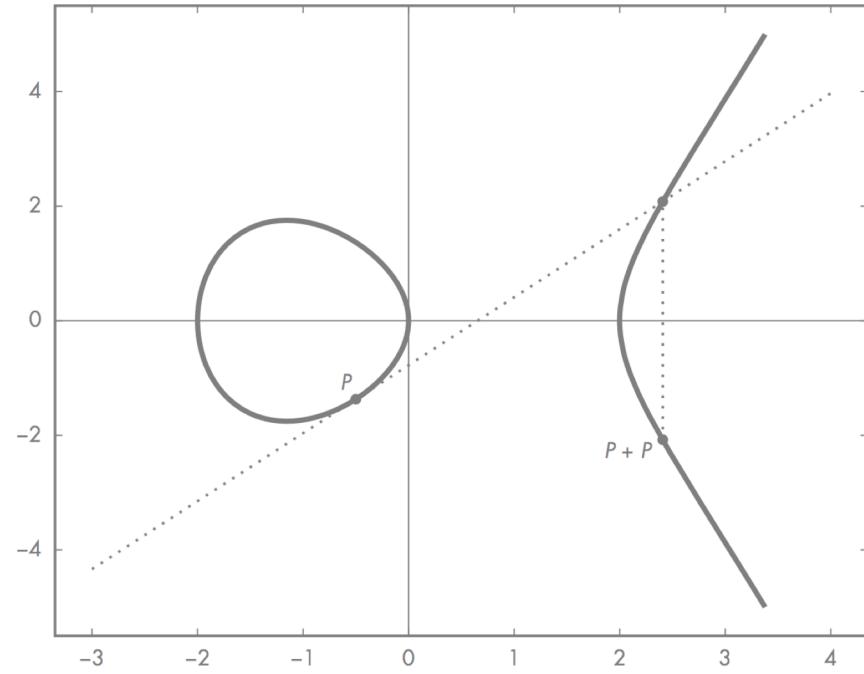

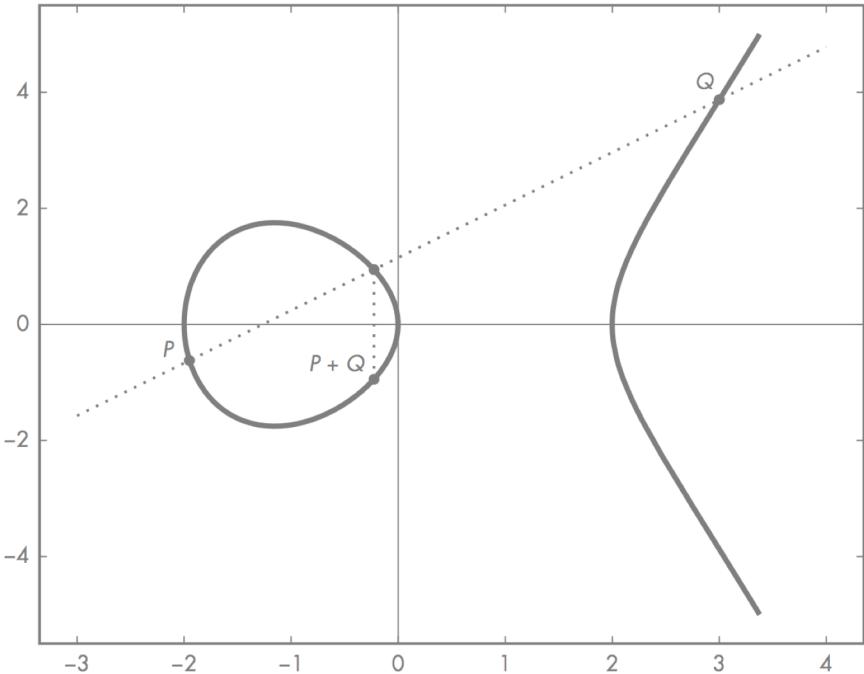

Elliptic curve over Integers

- Example: $y^2 = x^3 - 4x$ over Z_{191}
 - Z_{191} : the set of integers modulo 191

Operations

- Addition
 - $R = P + Q$
- Scalar multiplication
 - $Q = tP = P + \dots + P$

Difficult problems

- ECDLP
 - Given a base point P and a point Q in the group E where $Q = kP$, finding the number k
- ECCDH
 - Given a base point P and two points Q_1 and Q_2 in the group E where $Q_1 = k_1 P$ and $Q_2 = k_2 P$, finding the point $Q = k_1 k_2 P$
- ECDDH
 - Given a base point P and two points Q_1 and Q_2 in the group E where $Q_1 = k_1 P$ and $Q_2 = k_2 P$, distinguish the point $Q = k_1 k_2 P$ from a uniform element of E .

Man-in-the-middle to EC(DH)

E, G, q

$$k_1 = xh$$

$$x \leftarrow Z_q$$

$$h_1 = xG$$

$$k_3 = ch_1, k_4 = ch_2$$

$$c \leftarrow Z_q$$

$$h = cG$$

$$k_2 = yh$$

$$y \leftarrow Z_q$$

$$h_2 = yG$$

- Solution:
 - Introduce authentication in the protocol.

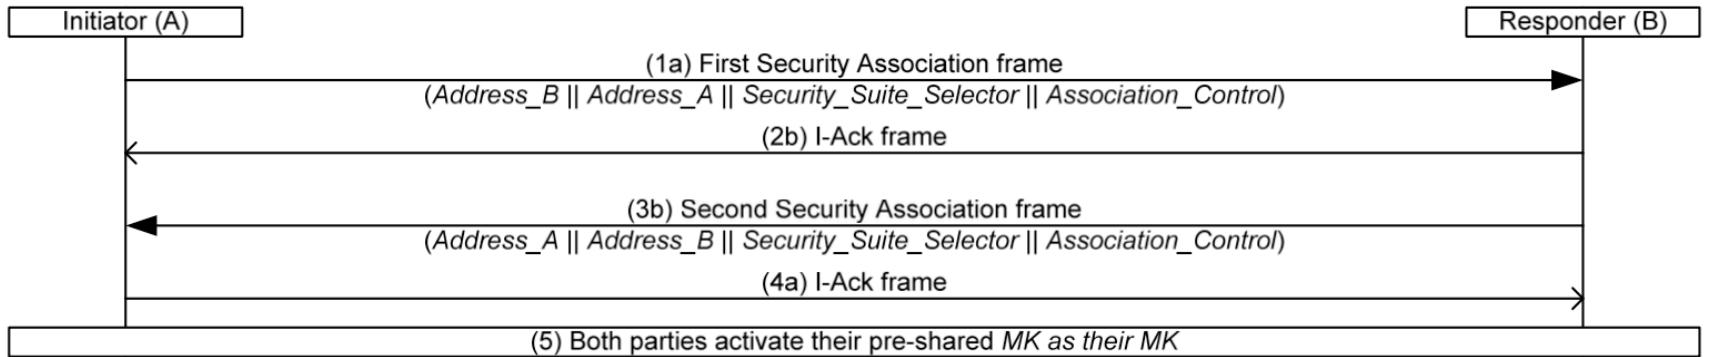

3. ECDH-based AKE in Standards

ECDH-based AKE in IEEE 802.15.6

- Secure association:
 - 1 Activating a pre-shared or generating a new shared master key (MK)
 - Master key pre-shared association
 - Unauthenticated association
 - Public key hidden association
 - Password authenticated association
 - Display authenticated association
 - 2 Pairwise temporal key (PTK) creation
- Group temporal key (GTK) distribution

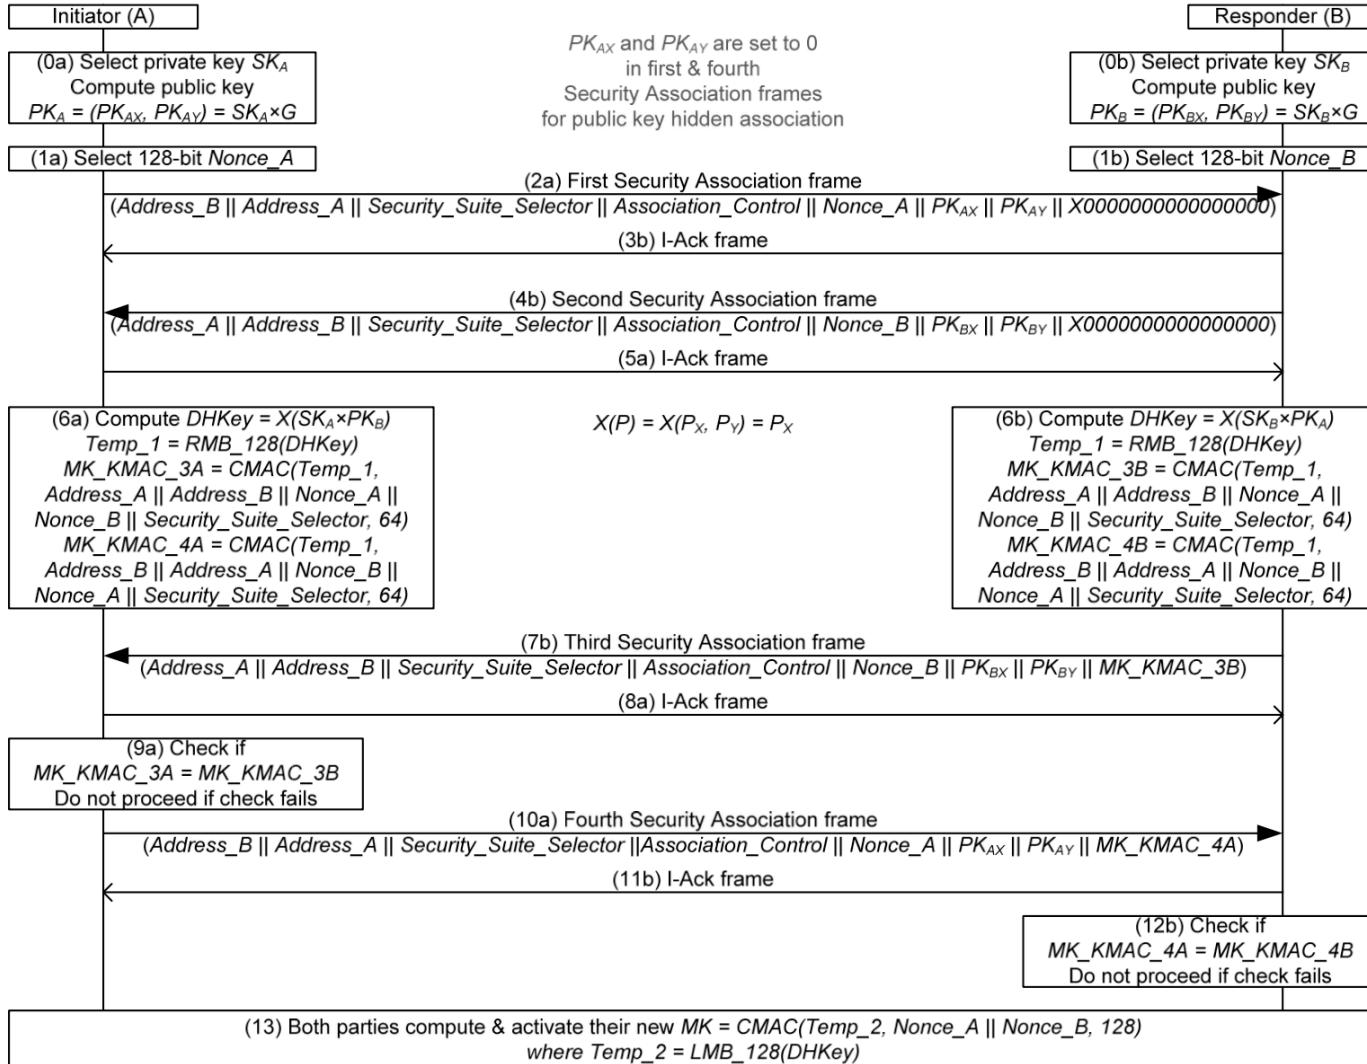

ECDH-based AKE in IEEE 802.15.6

- Master key pre-shared association

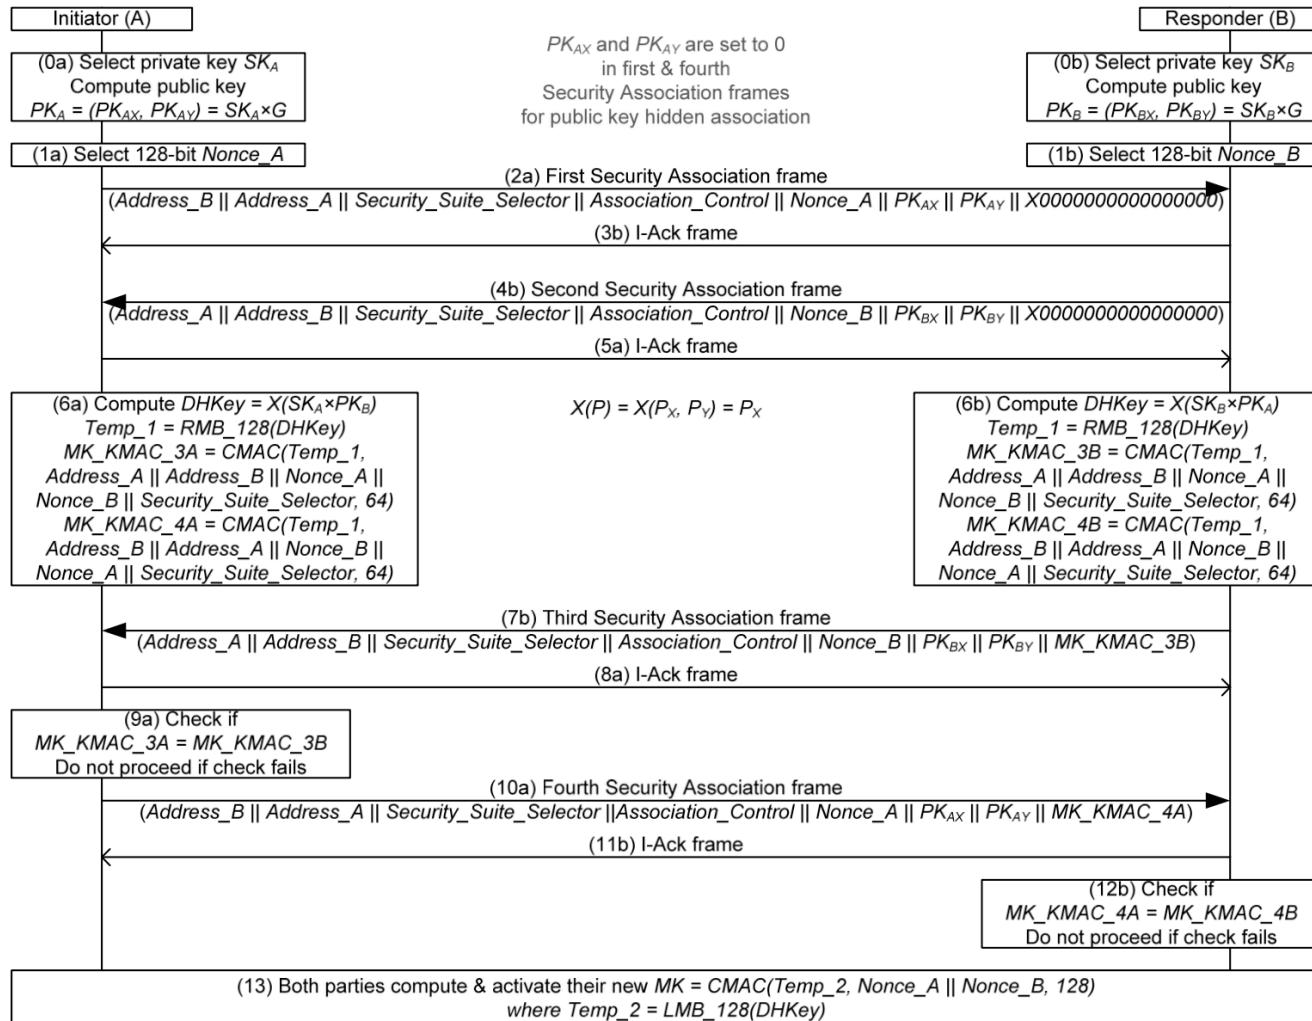

ECDH-based AKE in IEEE 802.15.6

- Unauthenticated association

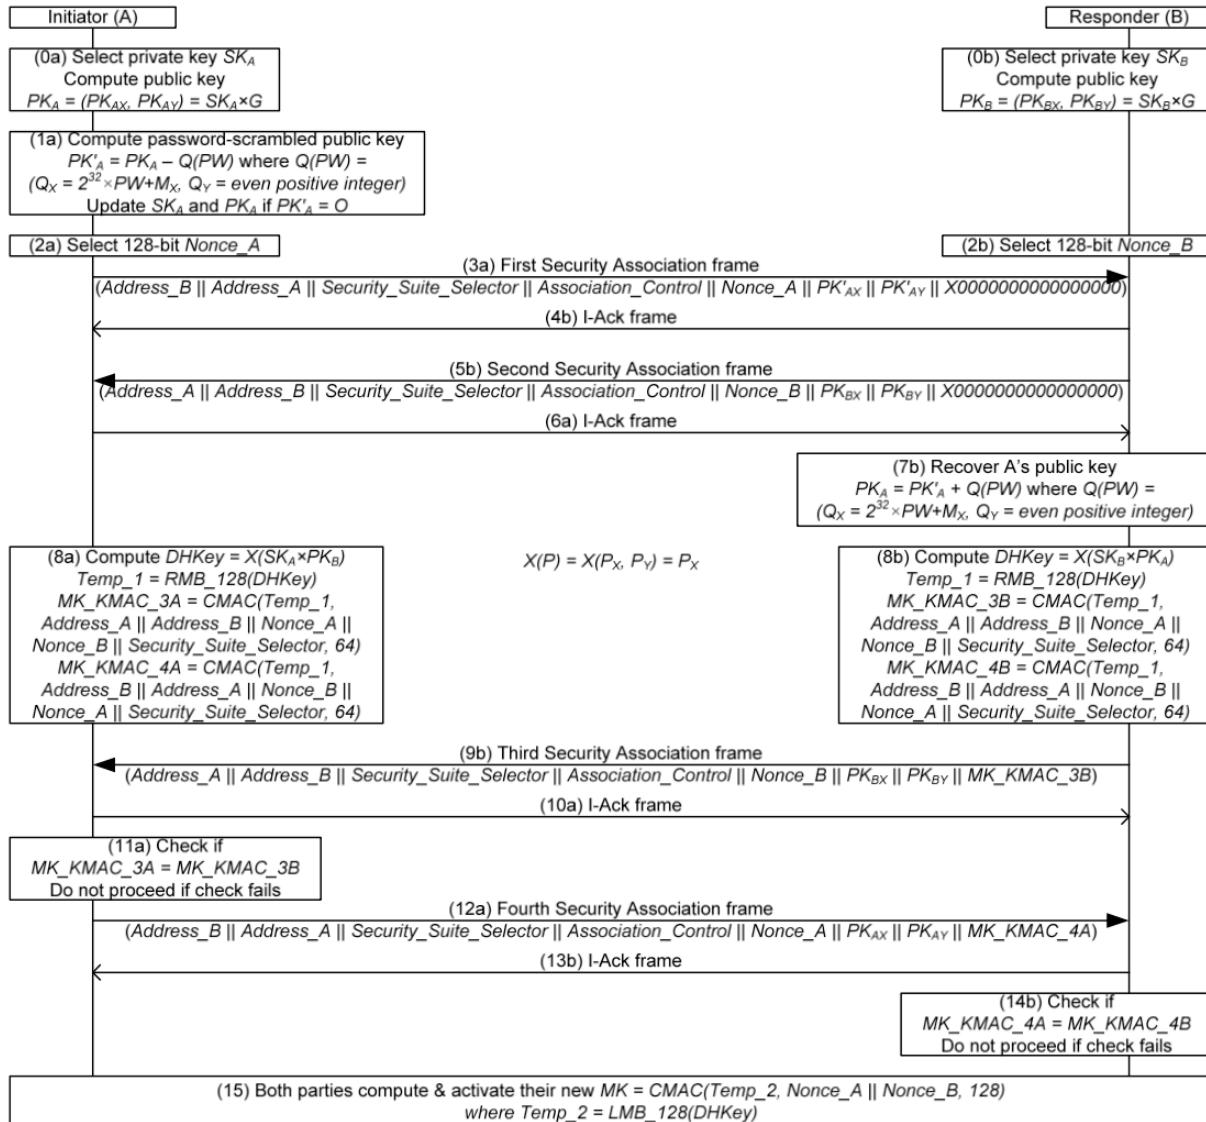

ECDH-based AKE in IEEE 802.15.6

- Public key hidden association
 - A's public key is securely transferred to the hub

ECDH-based AKE in IEEE 802.15.6

- Password authenticated association

ECDH-based AKE in IEEE 802.15.6

- Display authenticated association

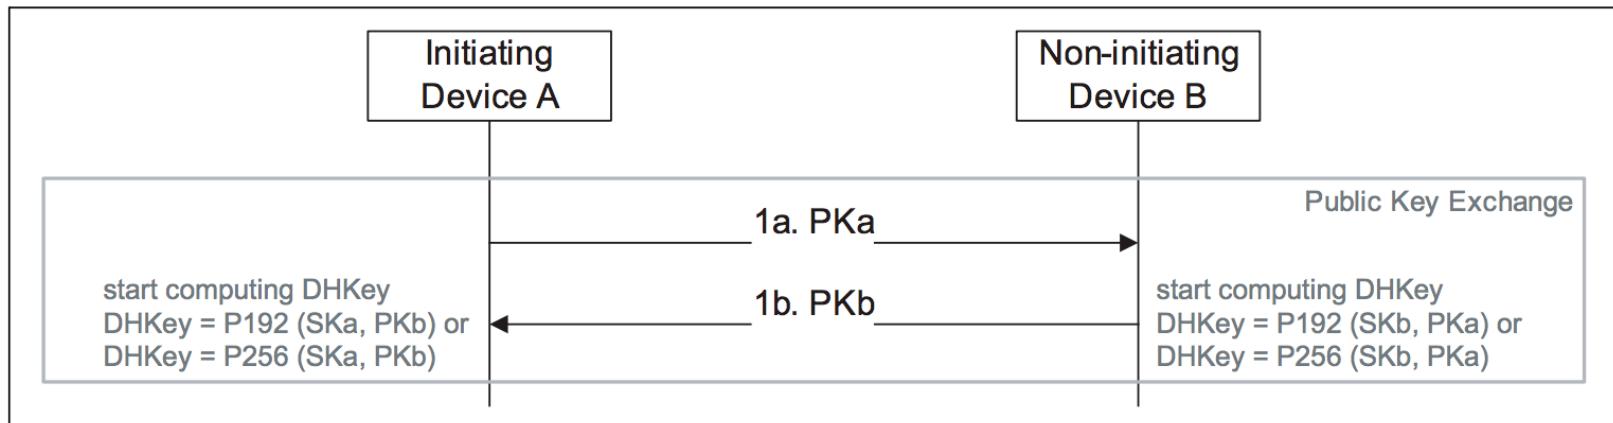

ECDH-based AKE in Bluetooth 5.0

- Bluetooth secure simple pairing
 - 1 Public key exchange
 - 2 Authentication stage 1
 - Numeric comparison
 - Out of band
 - Passkey entry
 - 3 Authentication stage 2
 - 4 Link key calculation

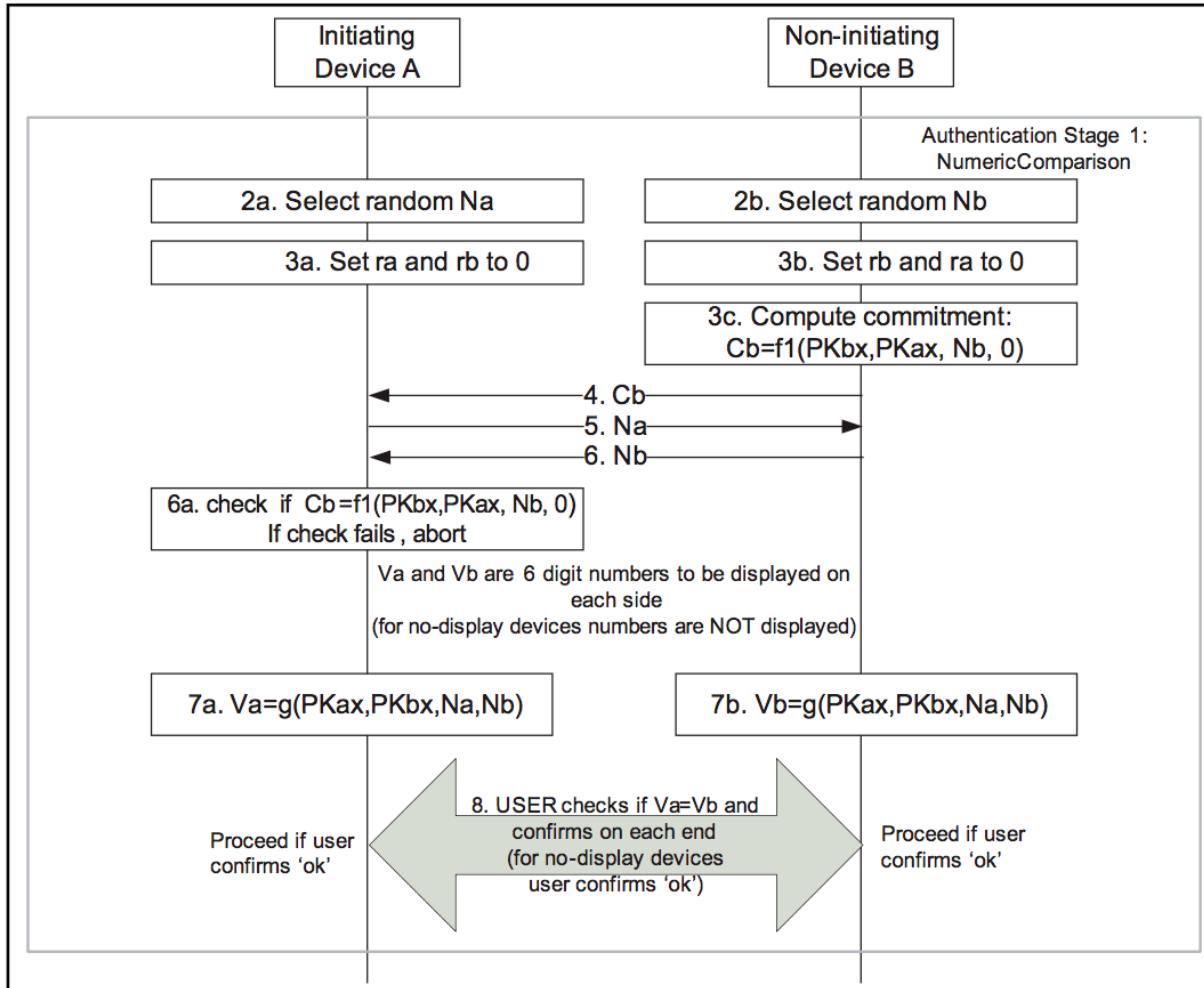

ECDH-based AKE in Bluetooth 5.0

- 1 Public key exchange

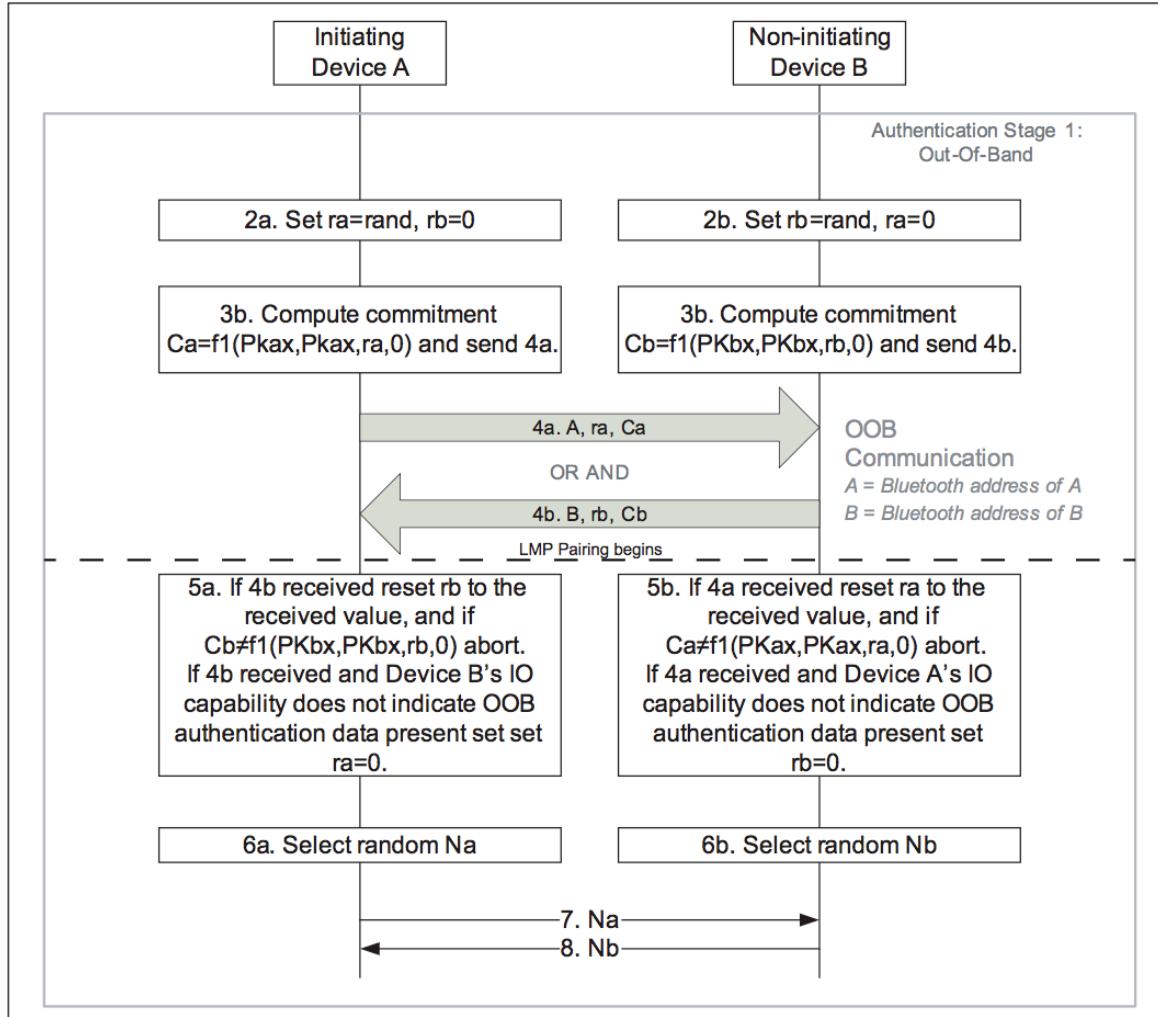

ECDH-based AKE in Bluetooth 5.0

- 2 Authentication stage 1 with numeric comparison

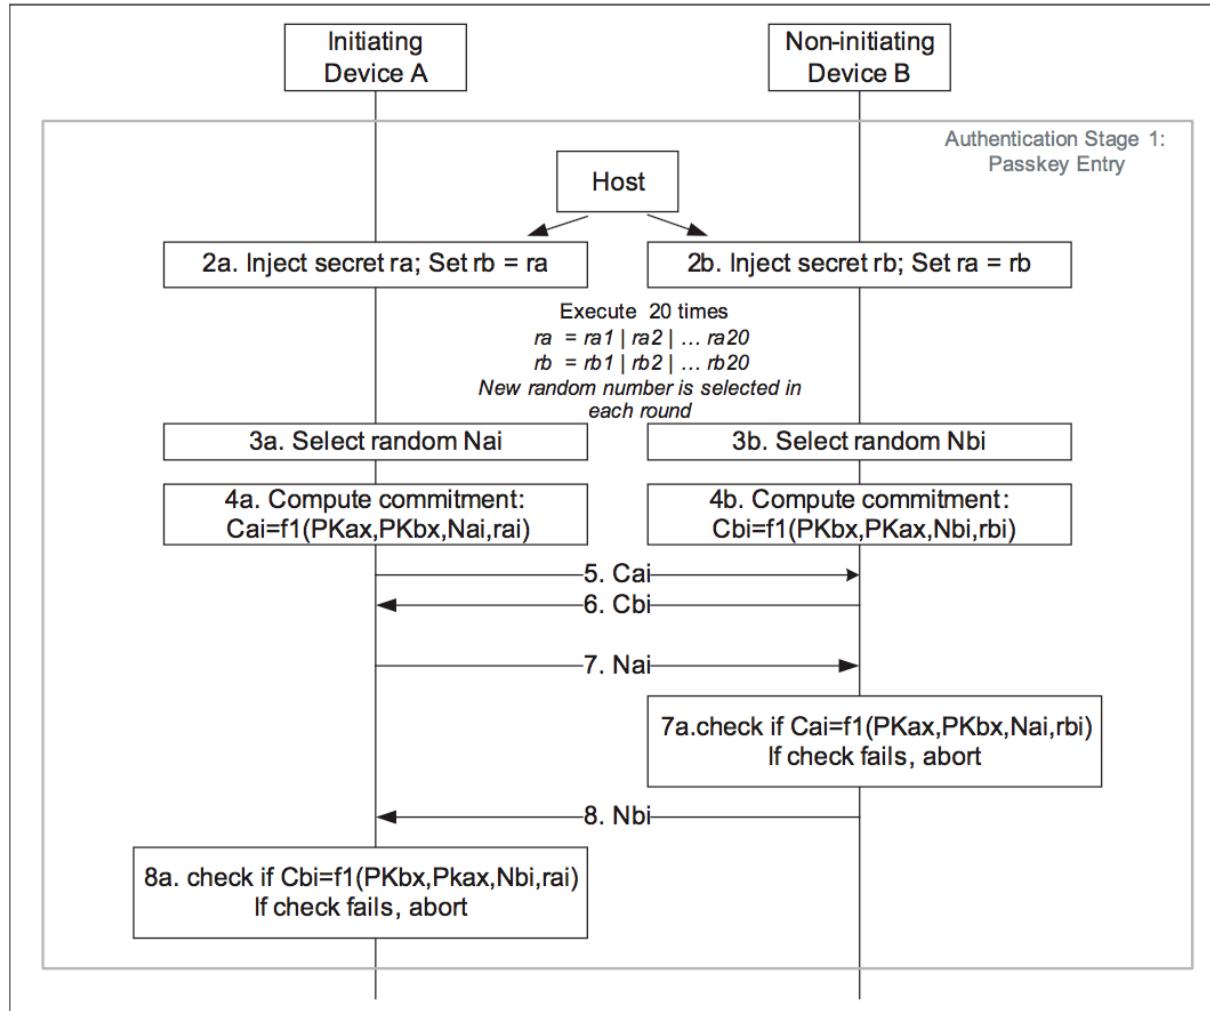

ECDH-based AKE in Bluetooth 5.0

- 2 Authentication stage 1 with out of band

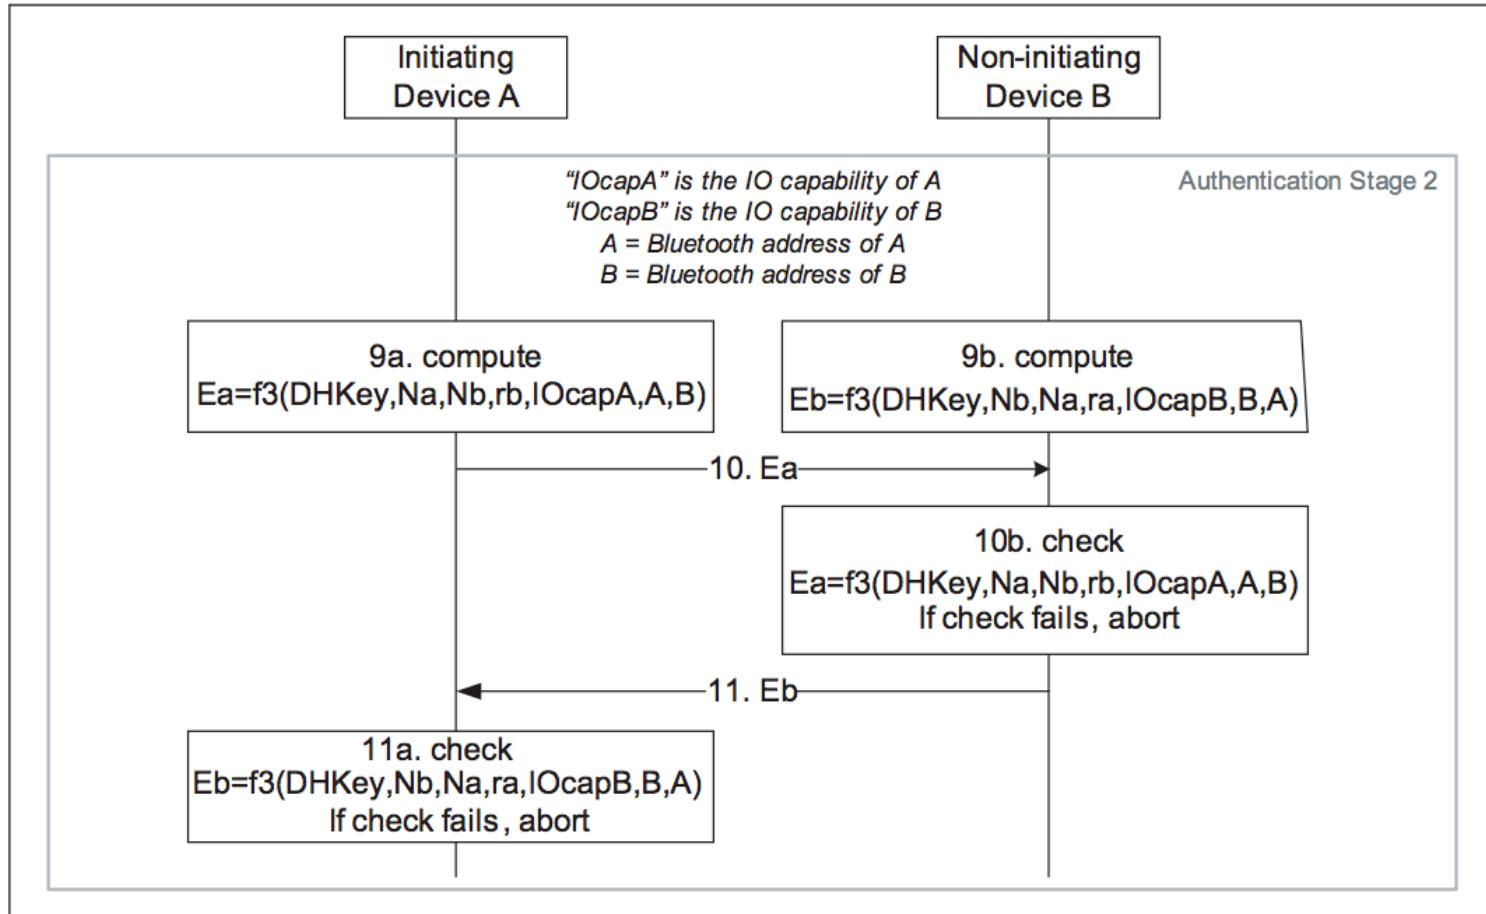

ECDH-based AKE in Bluetooth 5.0

- 2 Authentication stage 1 with passkey entry

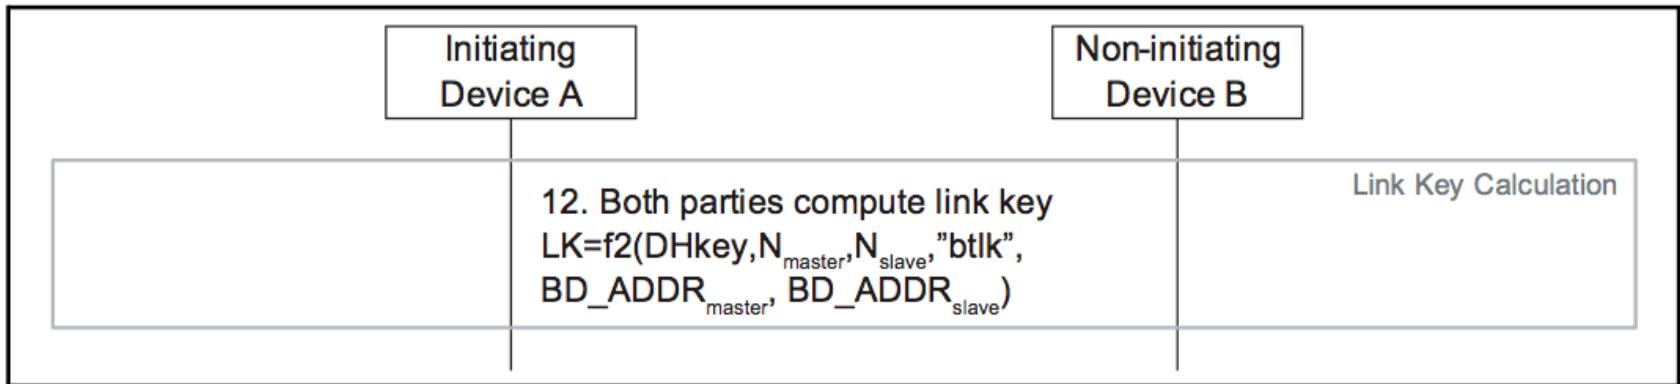

ECDH-based AKE in Bluetooth 5.0

- 3 Authentication stage 2

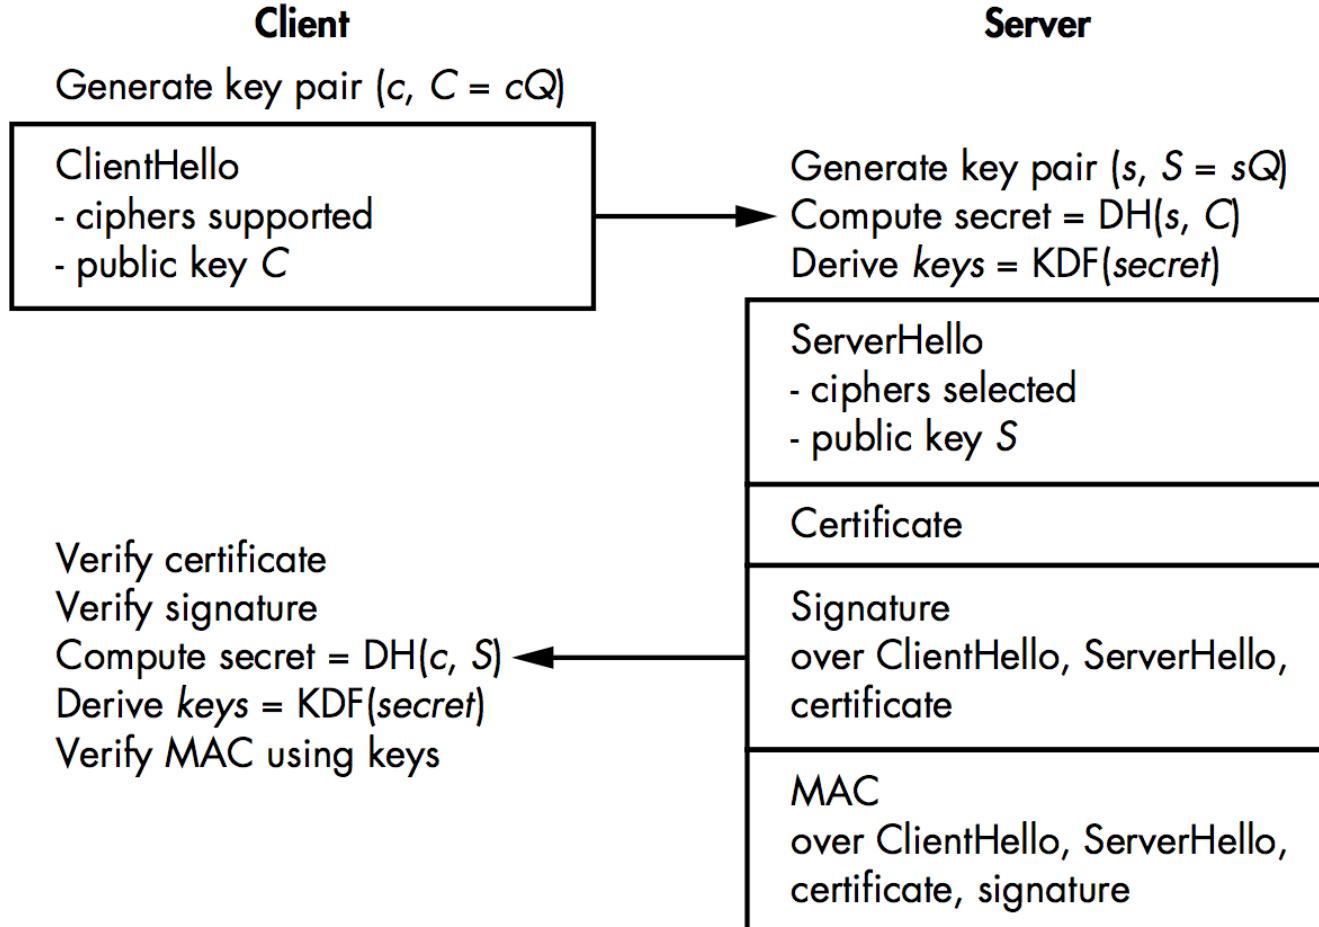

ECDH-based AKE in Bluetooth 5.0

- 4 Link key calculation

ECDH-based AKE in TLS 1.3

- TLS handshake with certificate

Experiments

- In the package “ieee802.15.6”

- wban1coordinator.py
- wban1sensor.py

**Public key hidden
association**

- wban2coordinator.py
- wban2sensor.py

**Password authenticated
association**

- wban3coordinator.py
- wban3sensor.py

**Display authenticated
association**

Experiments

- In the package “bluetooth5.0”

- bluetooth1A.py
- bluetooth1B.py

out of band-based

- bluetooth2A.py
- bluetooth2B.py

numeric comparison-based

Experiments

- In the package “tls1.3”

- `tlsclient.py`
- `tlsserver.py`

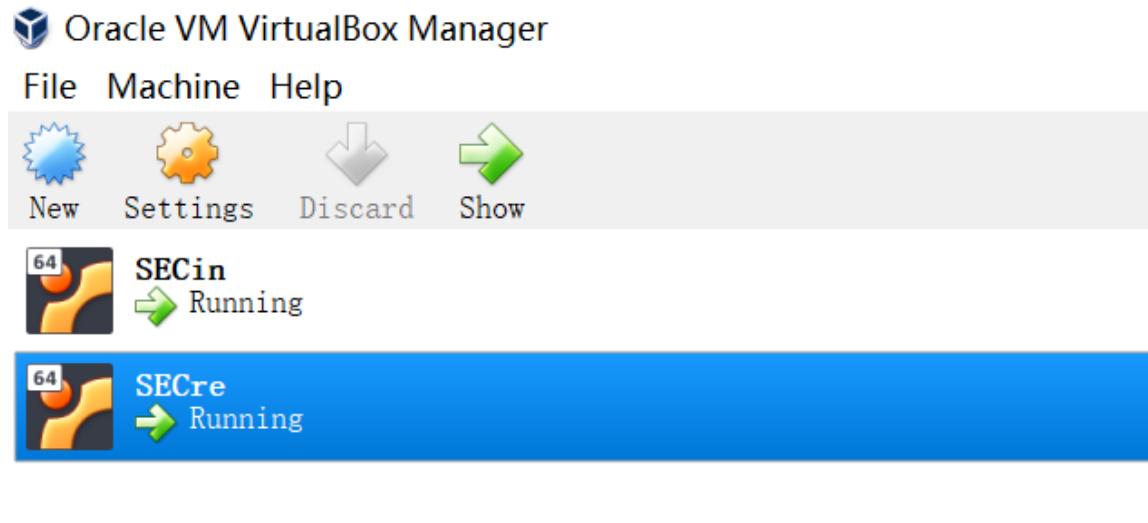

To run the protocols

- Python2.7
- ecc package
- Run coordinator.py and sensor.py respectively in
 - two virtual machines
 - two laptops
 - a laptop and a virtual machine
- Change the address into the ip of your coordinator machine
- Run coordinator.py before sensor.py

```
HOST = '10.8.106.95'  
PORT = 6633
```

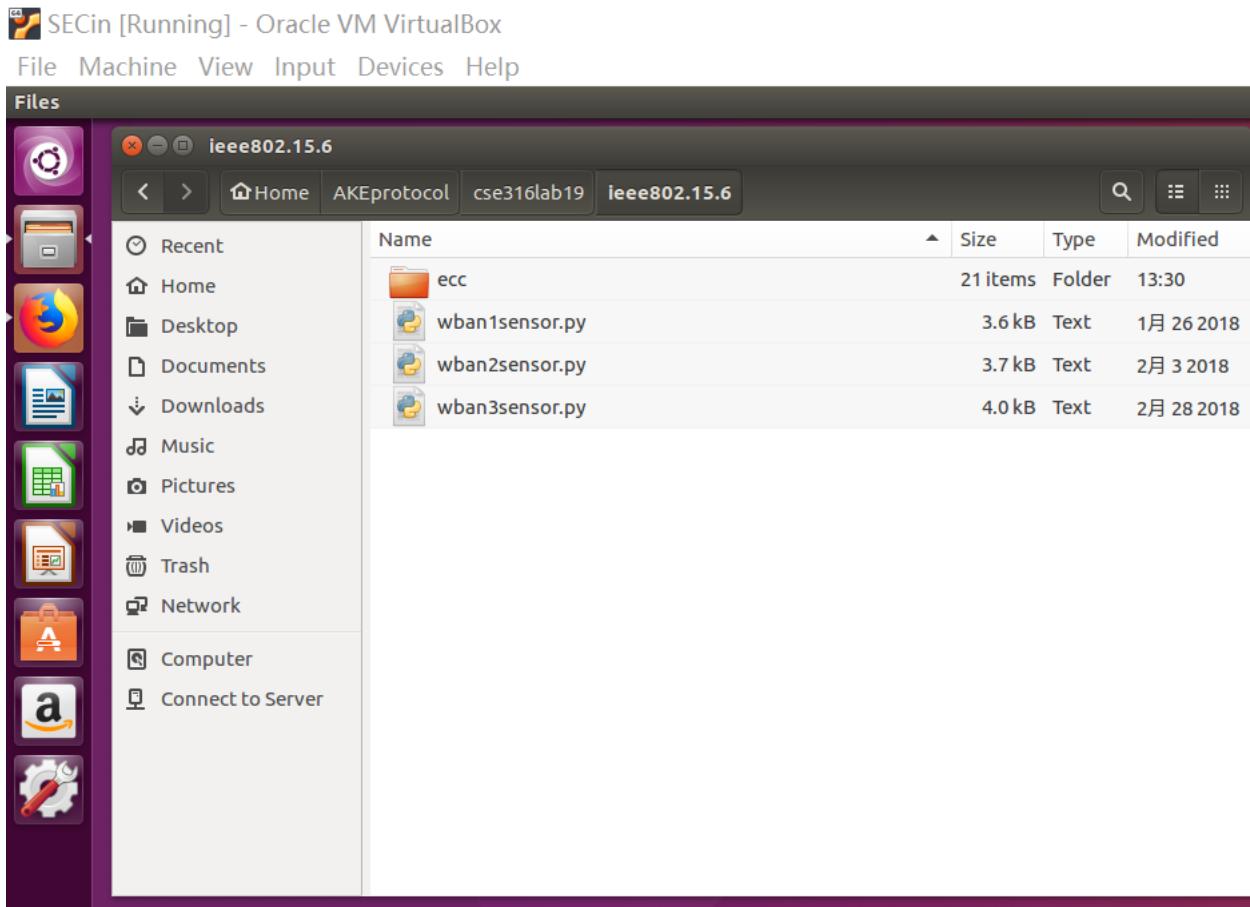

Example: WBAN1

- Two virtual machines with the same configuration
 - SECin: initiator, client, sensor
 - SECRe: responder, server, coordinator

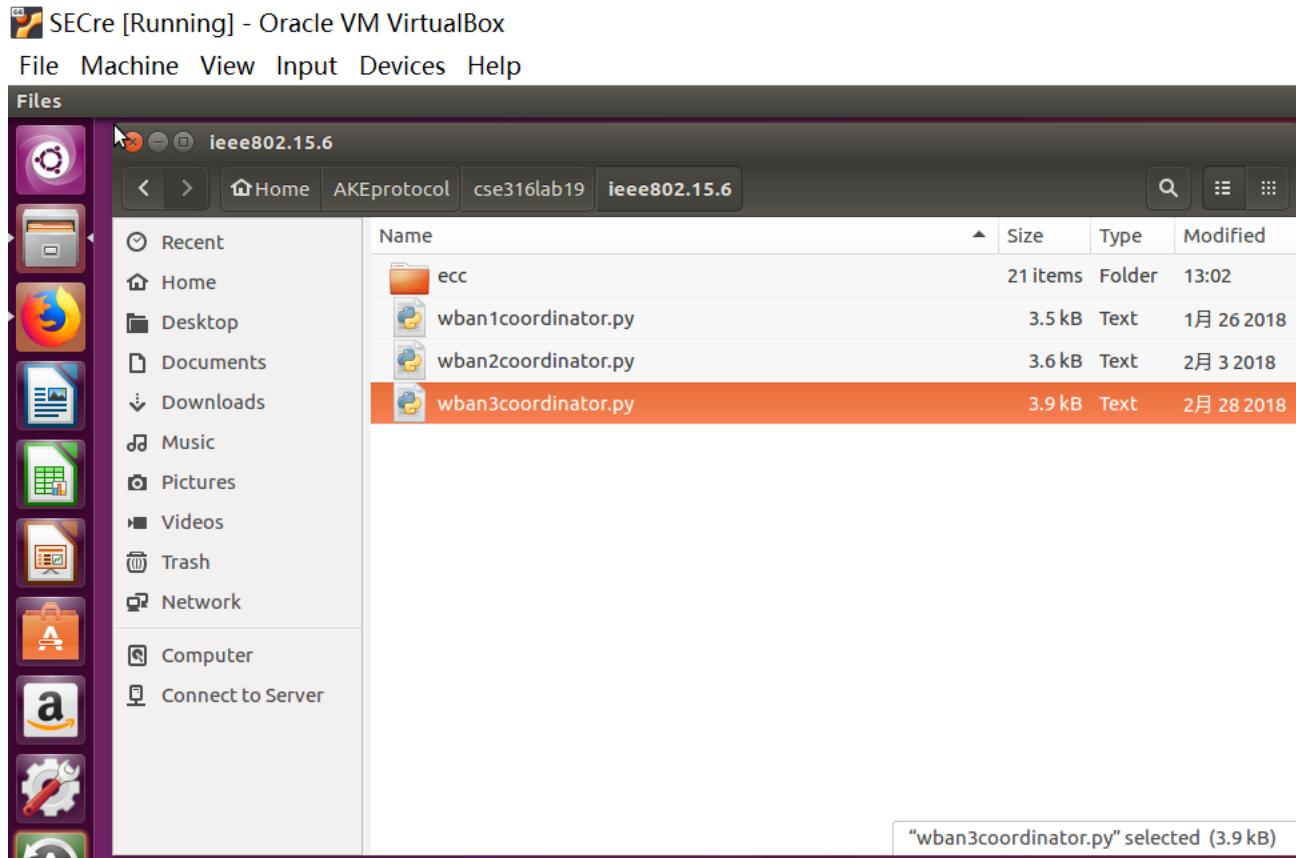

Example: WBAN1

- SECin: initiator, client, sensor

Example: WBAN1

- SECRe: responder, server, coordinator

Example: WBAN1

- IP address in SECRe is 192.168.0.108
- Change the value in both wban1coordinator.py and wban1sensor.py into 192.168.0.108

```
miao@miao-VirtualBox: ~/AKEprotocol/cse316lab19/ieee802.15.6$ ifconfig
